

Amendments to the Claims:

This listing of claims will replace all prior versions and listing of claims in the application:

Listing of Claims:

1. (withdrawn) A control cable adjustment device for adjusting a control cable extending between a control mechanism and an operating mechanism, the adjustment device comprising:

an adjuster rotatably connected to a housing of the control mechanism such that the adjuster is axially movable relative to the housing in response to rotation of the adjuster;

a spring element having a retention segment and a spring segment; and

a detent contour extending along an interior surface of the adjuster,

the retention segment of the spring element engageable with the detent contour to retain the adjuster in a current position and the spring segment of the spring element engaged with a movable member of the control mechanism.

2. (withdrawn) The control cable adjustment device of claim 1, wherein the spring element is a wireform spring, the retention segment of the spring extending substantially parallel to the control cable extending through the adjuster.

3. (withdrawn) The control cable adjustment device of claim 1, wherein the retention segment indexes the adjuster and the spring segment biases one of a release lever of a shifter and a brake lever toward a neutral position.

4. (canceled)

5. (withdrawn) The control cable adjustment device of claim 1, wherein the retention segment is braced torsionally against the housing, and a deflection motion of the retention segment is in the radial direction.

6. (withdrawn) The control cable adjustment device of claim 1, wherein the spring element is guided through the housing, and the retention segment is supported by the housing near the adjuster.

7. (withdrawn) The control cable adjustment device of claim 1, wherein the detent contour has a non-round cross section and is configured such that the retention segment has freedom to deflect, the retention segment configured to extend substantially parallel with a portion of the control cable extending through the adjuster.

8. (withdrawn) The control cable adjustment device of claim 1, wherein the detent contour has flutes extending in an axial direction of the adjuster.

9. (withdrawn) The control cable adjustment device of claim 1, wherein the adjuster has a continuous periphery and a thread for matingly engaging the housing, the detent contour extending coaxially with the adjuster thread.

10. (withdrawn) The control cable adjustment device of claim 1, wherein the adjuster has a control cable insertion slot that is offset from a portion of the control cable extending through the adjuster so that the spring element is prevented from entering the control cable insertion slot.

11. (withdrawn) The control cable adjustment device of claim 1, wherein the radial motion of the retention segment of the spring element is restricted by at least one stop located in the housing for preventing the spring element from entering the control cable insertion slot.

12. (withdrawn) The control cable adjustment device of claim 2, wherein the retention segment includes at least two flexible segments extending substantially parallel to a portion of the control cable extending through the adjuster, the two flexible segments

engaging an inner surface of the detent contour of the adjuster, the two flexible segments preloaded in the radial direction.

13. (withdrawn) The control cable adjustment device of claim 12, wherein upon rotation of the adjuster, the flexible segments are supported by the housing near the adjuster.

14. (withdrawn) The control cable adjustment device of claim 1, wherein the detent contour includes varying surfaces configured to engage the retention segment such that rotation of the adjuster in a first direction requires a higher rotational force than rotation of the adjuster in a second direction.

15. (currently amended) A control cable adjustment device for adjusting a control cable extending between a control mechanism and an operating mechanism, the adjustment device comprising:

an adjuster having an axial bore, the adjuster rotatably connected to a housing of the control mechanism such that the adjuster is axially moved ~~movable~~ relative to the housing in response to rotation of the adjuster; and

a detent mechanism including a radially interior detent contour extending axially within the bore ~~along a radial interior surface of the adjuster~~ and a spring element having at least one retention segment extending axially within the bore and a support segment, the retention segment of the spring element engaging the detent contour from within the adjuster, the support segment of the spring element supported by the housing.

16. (previously presented) The control cable adjustment device for claim 15, wherein the detent contour has a non-round cross section and is configured such that the retention segment has freedom to deflect, the retention segment configured to extend substantially parallel with the control cable extending through the adjuster.

17. (original) The control cable adjustment device of claim 15, wherein the detent contour includes varying surfaces configured to engage the retention segment such

that rotation of the adjuster in a first direction requires a higher rotational force than rotation of the adjuster in a second direction.

18. (original) The control cable adjustment device of claim 15, wherein the detent contour has flutes extending in an axial direction of the adjuster.

19. (previously presented) The control cable adjustment device of claim 15, wherein the retention segment includes at least two flexible segments extending substantially parallel to a portion of the control cable extending through the adjuster, the two flexible segments engaging the inner surface of the detent contour of the adjuster, the two flexible segments preloaded in the radial direction.

20. (withdrawn) The control cable adjustment device of claim 19, wherein the housing includes a control cable insertion slot and the support segment of the spring element is supported in the control cable insertion slot.

21. (original) The control cable adjustment device of claim 15, wherein the retention segment and the support segment of the spring element are loaded primarily flexurally.

22. (previously presented) The control cable adjustment device of claim 15, wherein the adjuster has a continuous periphery and a thread for matingly engaging the housing, the detent contour extends coaxially with the adjuster thread.

23. (previously presented) The control cable adjustment device of claim 15, the adjuster has a control cable insertion slot that is offset from the control cable extending through the adjuster so that the spring element is prevented from entering the control cable insertion slot.

24. (withdrawn) The control cable adjustment device of claim 15, wherein the radial motion of the retention segment of the spring element is restricted by at least one stop

Serial No. 10/605,852

located in the housing for preventing the spring element from entering the control cable insertion slot.

25. (currently amended) The control cable adjustment device of claim 15, wherein the retention segment of the spring element deformably ~~traversing~~ traverses along the detent contour from within the adjuster.
